

## FoldUP! 3D™

### Visualize fold-up designs.

FoldUp!3D creates a 3D image based on your Illustrator artwork and the cut or fold lines. Those lines can easily be imported from a box design done in AlphaCorr Rules™ packaging and point-of-purchase design software. It's a perfect plug-in for visualizing packaging projects, dimensional mailers, or any other folding paper design.

### Easy Interface

FoldUp!3D is known for its ease of use among packaging and point-of-purchase design professionals and first time users alike.

### Easy Positioning

The new position palette lets you save various views of your image using different positions, zoom levels, rotations or steps within the folding process. One design can support a number of standard positions used for print, web, or special promotions.

### Free Viewer

The new FoldUP! 3D Viewer lets your associates examine your packaging and point-of-purchase display design fully in 3D. Two versions are available: one standalone and the other as a plug-in for Illustrator.

### Thickness Function

FoldUp!3D allows easy previewing of A flute, B flute and AB flute with the new Thickness function. By simulating the paper type or paper thickness an illusion of proximity is created. Input a numeric paper thickness or select a flute to preview.

### Dimensional Designs

FoldUp!3D is great for any flat print design not intended to be seen on a flat page. Die cut designs, 3D trade show and point-of-purchase displays, and greeting cards can all be mocked up and proofed directly in Adobe Illustrator.

### Export Control

With more export features to share your design, FoldUp!3D exports to web, print, as a QuickTime movie, or as a model file. Custom settings give you control of display and file size for the desired resolution.

### Support for Mac and Windows

FoldUp!3D supports both Mac and Windows platforms, including Mac OS OS X, Windows 7, Vista or XP.

Create a 3D image based on Illustrator artwork and the cut or fold lines in FoldUp!3D.

Above: Custom settings offer complete control of display and file size for the desired resolution.

Below left: The free viewer lets others examine your packaging and display designs in 3D.

Below right: The Thickness function simulates paper type and thickness for an illusion of proximity.
